

A THE SAME-SOURCE PROBLEM

An agent reviewed by its own twin

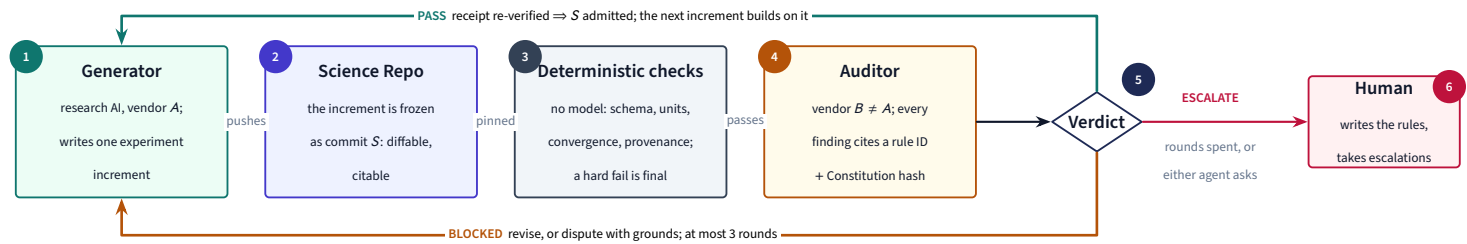

B THREE COMMITMENTS

Split the vendor, then write it all down

- Heterogeneity**
the Auditor's vendor differs from the Generator's, decorrelating blind spots
I1
 - Git-native ledger**
every increment, report, verdict, dispute and escalation is a commit
I2 - I3
 - Graded oversight**
model-free checks gate first; only BLOCKER halts; bounded rounds, then escalate
I4 - I6
- A claim is admitted not because an agent asserted it, but because a second vendor re-verified a pinned commit against a versioned rulebook.

C THE PROTOCOL

one experiment increment; the Auditor has no write access to the Science Repo

D WHAT THE LOOP LEAVES BEHIND

each stage emits one citable object; no supervision state lives only in platform logs
